- Maintain safety against collapse (Ultimate Limit State)
- Provide acceptable performance during service (Serviceability Limit State)

This approach involves using load factors and resistance factors to account for uncertainties in load estimation and material strengths.

Step-by-Step Design Procedure

- Determine Loads and Load Combinations:

Using applicable factors, calculate factored loads based on the code's prescribed combinations.

- Select Structural System and Materials:

Decide on the type of reinforced concrete member (beam, slab, column) and specify concrete strength and reinforcement grade.

$$V_c = 0.6 \phi f'_c b d$$

- Shear Reinforcement:

When shear forces exceed V_c , shear stirrups or ties are required, with spacing and size governed by the code.

Axial Load and Combined Bending and Axial Forces

- The interaction between axial loads and bending moments is addressed through interaction diagrams and formulas, ensuring the combined effects do not compromise structural integrity.

Serviceability and Durability Considerations

Crack Control and Deflection

- The code prescribes maximum crack widths for different exposure conditions, influencing reinforcement detailing.
- Deflection limits are specified to prevent excessive bending or vibration, with calculations based on stiffness and loading.

Durability
