Applying Control System Analysis and Design Using MATLAB

Modeling and System Representation

The starting point in control system analysis is accurate modeling. MATLAB simplifies this through functions like ``tf`` for transfer functions and ``ss`` for state-space models.

Example: Modeling a DC motor:

```
```matlab
```

```
% Transfer function of a DC motor
```

```
J = 0.01; % Moment of inertia
```

```
b = 0.1; % Viscous friction coefficient
```

```
K = 0.01; % Motor torque constant
```

```
R = 1; % Electric resistance

L = 0.5; % Electric inductance

s = tf('s');

P_motor = K/((Js + b)(Ls + R) + K^2);

...
```

This representation enables subsequent analysis and controller design grounded in Ogata's modeling principles.

## Analyzing System Response

Once modeled, engineers analyze transient and steady-state behavior:

- Time Response: Using `step` and `impz` to observe system behavior.
- Frequency Response: Using `bode` and `nyquist` plots to examine gain and phase margins.

Example:

```
%% matlab

figure;

step(P_motor);

title('DC Motor Step Response');

...
```

This visualization helps in understanding the system's stability and responsiveness, key considerations in Ogata's control design framework.

## Designing Controllers

Based on analysis, controllers are designed to meet specified performance criteria such as stability, overshoot, and settling time.

PID Controller Design:

```
```matlab

C = pid(1, 0.1, 0.01); % Proportional-Integral-Derivative controller

T_closed = feedback(CP_motor, 1);

step(T_closed);

title('Closed-Loop Response with PID Controller');

```
```

Root Locus Method:

```
```matlab

rlocus(P_motor);

```
```

This graphical method illustrates how the poles of the closed-loop system move with controller gain adjustments, aligning with Ogata's root locus techniques.

## Advanced Topics in MATLAB for Control Engineering as per Ogata

### State-Space Control and Modern Techniques

Ogata emphasizes the importance of state-space models for modern control design. MATLAB facilitates this through commands like ``ctrb``, ``obsv``, ``place``, and ``lqr``.

Controllability and Observability:

```
```matlab

A = [0 1; -2 -3];

B = [0; 1];

C = [1 0];
```

D = 0;

sys_ss = ss(A, B, C, D);

co = ctrb(sys_ss);

ob = obsv(sys_ss);

...

Pole Placement:

```matlab

desired\_poles = [-2, -3];

K = place(A, B, desired\_poles);

...

Optimal Control:

```matlab

Q = C'C;

R = 1;

K_lqr = lqr(A, B, Q, R);

...

These capabilities directly support Ogata's modern control design teachings.

Digital Control System Design

The transition from continuous to discrete systems is seamlessly managed in MATLAB:

```matlab

Ts = 0.01; % Sampling time

```
sys_d = c2d(P_motor, Ts, 'zoh');
```

```
```
```

Designing digital controllers involves discretizing analog controllers or directly designing in the z-domain, enabling implementation in digital control hardware.
