Design a distillation column to separate a mixture of 50 mol% ethanol and 50 mol% water. Feed flow rate is 100 kmol/hr at 1 atm, with a desired top product of 95 mol% ethanol and bottom product of 5 mol%. Determine the reflux ratio and total number of stages.

Solution Steps:

- **Set Up the Process Flow Diagram:**
 - Use a feed stream at specified conditions
 - Add a distillation column module
 - Specify feed stage, condenser, and reboiler locations
- **Input Material Properties:**
 - Define ethanol-water mixture using appropriate thermodynamic model (e.g., NRTL)
- **Define Operating Conditions:**

- Feed composition, flow rate, pressure, and temperature
- Specify product compositions for top and bottom streams
- **Run the Simulation:**
- ChemCad calculates the equilibrium stages, reflux ratio, and other parameters
- **Analyze Results:**
- Check the number of theoretical stages and the reflux ratio
- Adjust parameters if necessary for optimization

Key Results:

- Reflux ratio: approximately 2.5
- Number of stages: around 15 (depending on the thermodynamic model accuracy)

Note: This example demonstrates how ChemCad simplifies complex distillation calculations by integrating thermodynamics and mass transfer models.

Example 2: Heat Exchanger Network Design

Problem Statement:

Design a heat exchanger network where hot oil at 200°C heats a feed stream from 30°C to 80°C, and the cooled oil exits at 150°C. The feed flow rate is 50 kg/hr, and the specific heat capacity is 2.1 kJ/kg·K.

Solution Steps:

- **Model the Hot and Cold Streams:**
- Create streams with specified temperatures, flow rates, and heat capacities
- **Add Heat Exchanger Module:**
- Connect hot and cold streams to the exchanger

- Calculate Heat Duty:

- Use $Q = m \times C_p \times \Delta T$ for both streams

- Set Heat Transfer Parameters:

- Input calculated duty into ChemCad's heat exchanger module

- Optimize the Design:

- Adjust flow rates or temperatures to meet process requirements

Results:

- Heat duty required: $50 \text{ kg/hr} \times 2.1 \text{ kJ/kg}\cdot\text{K} \times (80^\circ\text{C} - 30^\circ\text{C}) = 5,250 \text{ kJ/hr}$
- The cooled oil exiting at 150°C can be used elsewhere, or further cooling can be integrated.

This example illustrates how ChemCad handles heat exchange calculations and network optimization efficiently.

Example 3: Reactor Design and Conversion Calculation

Problem Statement:

Simulate a continuous stirred-tank reactor (CSTR) converting A to B with a first-order reaction rate of $k=0.1 \text{ min}^{-1}$. Feed contains 1 mol/min of A at 25°C and 1 atm. Determine the reactor volume needed to achieve 80% conversion.

Solution Steps:

- Set Up the Reactor Module:

- Select a CSTR block in ChemCad

- Input Feed Conditions:

- Flow rate, temperature, pressure, and composition

- Define Reaction Kinetics:

- Enter reaction rate parameters into the reactor module

- Specify Conversion Goal:

- Set target conversion of 80%

- Calculate Reactor Volume:

- Use the first-order reaction equation:

$$V = (F_{A0} \times X) / (k \times (1 - X))$$

- Where F_{A0} = molar flow rate of A, X = conversion

Calculation:

$$V = (1 \text{ mol/min} \times 0.8) / (0.1 \text{ min}^{-1} \times 0.2) = 4 \text{ mol} / (0.02 \text{ mol/min}) = 200 \text{ min}$$

Since the molar flow rate is 1 mol/min, the volume is proportional to the residence time, leading to a reactor volume corresponding to a residence time of 200 minutes.

Results:

- Reactor volume: approximately 200 liters (assuming ideal conditions and unit conversions)

This example demonstrates the integration of reaction kinetics with process simulation in ChemCad.

Advanced Applications and Troubleshooting with ChemCad 6

While the above examples cover fundamental processes, real-world applications often involve complexities like multistage distillation, heat integration, and dynamic simulations.

Detailed Solved Example in Chemical Engineering Roy: Material Balance in a Distillation Column

To illustrate the application of concepts, consider the following solved example related to material balance in a distillation process.

Problem Statement

A binary mixture of benzene and toluene is fed to a distillation column at a rate of 100 kmol/hr, with a feed composition of 40 mol% benzene. The overhead product contains 95 mol% benzene, and the bottom product contains 10 mol% benzene. Determine:

- The molar flow rates of the distillate and bottoms.
- The recovery of benzene in the distillate.

Solution Steps

Step 1: Write the overall material balance

\[

$$F = D + B$$

\\

Where:

- $(F = 100, \text{ kmol/hr})$ (feed rate)
- (D) = distillate flow rate (unknown)
- (B) = bottoms flow rate (unknown)

Step 2: Write the component balance for benzene

\\

$$F \times z_F = D \times x_D + B \times x_B$$

\\

Where:

- $(z_F = 0.40)$ (feed benzene molar fraction)
- $(x_D = 0.95)$ (distillate benzene molar fraction)
- $(x_B = 0.10)$ (bottoms benzene molar fraction)

Substituting:

\\

$$100 \times 0.40 = D \times 0.95 + (100 - D) \times 0.10$$

\\

\\

$$40 = 0.95 D + 10 - 0.10 D$$

\\

\\

$$40 - 10 = (0.95 - 0.10) D$$

$$\backslash]$$

$$\backslash[$$

$$30 = 0.85 D$$

$$\backslash]$$

$$\backslash[$$

$$D = \frac{30}{0.85} \approx 35.29, \text{ kmol/hr}$$

$$\backslash]$$

Then,

$$\backslash[$$

$$B = 100 - D = 100 - 35.29 \approx 64.71, \text{ kmol/hr}$$

$$\backslash]$$

Step 3: Calculate benzene recovery in the distillate

$$\backslash[$$

$$\text{Recovery} = \frac{\text{Benzene in distillate}}{\text{Benzene in feed}} \times 100\%$$

$$\backslash]$$

$$\backslash[$$

$$= \frac{D \times x_D}{F \times z_F} \times 100\%$$

$$\backslash]$$

$$\backslash[$$

$$= \frac{35.29 \times 0.95}{100 \times 0.40} \times 100\%$$

\]

\[

$$= \frac{33.52}{40} \times 100\% \approx 83.8\%$$

\]

Deep Dive: Solved Example 1 ? Material Balance in a Reactor

Problem Statement

A continuous stirred-tank reactor (CSTR) processes a reactant A to produce a product B. The feed contains 2 mol/min of A, and the reactor operates at steady state with an inlet concentration of A as 2 mol/min. The reaction is:

The rate of reaction follows first-order kinetics with a rate constant $k = 0.1 \text{ min}^{-1}$. The reactor volume is 100 liters. Calculate the concentration of A and B in the reactor and the conversion rate of A.

Step-by-Step Solution

Step 1: Write the Material Balance

For component A:

$$\begin{aligned} & \left[\right. \\ & \text{In} - \text{Out} + \text{Generation} = \text{Accumulation} \\ & \left. \right] \end{aligned}$$

At steady state, accumulation is zero:

$$\begin{aligned} & \left[\right. \\ & F_{\text{in}} C_{\text{A, in}} - F_{\text{out}} C_{\text{A}} - r_{\text{A}} V = 0 \\ & \left. \right] \end{aligned}$$

Since the flow rate is constant ($F_{\text{in}} = F_{\text{out}} = F$), the equation simplifies to:

$$\left[\right.$$

$$F (C_{A, in} - C_A) = r_A V$$

\\

Given data:

- \\(F = 2 \\, \text{mol/min} \\)
- \\(C_{A, in} = 2 \\, \text{mol/min} \\) (since feed rate is 2 mol/min of A)
- \\(V = 100 \\, \text{L} \\)
- \\(r_A = -k C_A \\) (for first-order reaction)

Step 2: Calculate the Reactor Concentration

Rearranged:

\\

$$F (C_{A, in} - C_A) = k C_A V$$

\\

Plugging in:

\\

$$2 (2 - C_A) = 0.1 \times C_A \times 100$$

\\

\\

$$4 - 2 C_A = 10 C_A$$

\\

\\

$$4 = 12 C_A$$

\\

$\backslash$

$$C_A = \frac{4}{12} = \frac{1}{3} \approx 0.333, \text{ mol/L}$$

 $\backslash$

Step 3: Find Concentration of B

Since A converts into B:

 $\backslash$

$$\text{Rate of formation of B} = -r_A = k C_A = 0.1 \times 0.333 = 0.0333, \text{ mol/L} \cdot \text{min}$$

 $\backslash$

Total moles of B formed per minute:

 $\backslash$

$$r_B = 0.0333 \times V = 0.0333 \times 100 = 3.33, \text{ mol/min}$$

 $\backslash$

Assuming ideal mixing and steady state, the concentration of B can be computed considering the inlet of B is zero:

 $\backslash$

$$\text{Mass balance for B: } 0 - F C_B + r_B V = 0$$

 $\backslash$ $\backslash$

$$F C_B = r_B V$$

 $\backslash$ $\backslash$

$$C_B = \frac{r_B V}{F} = \frac{3.33}{2} = 1.666, \text{ mol/L}$$

\\

Step 4: Calculate Conversion

Conversion of A:

\\

$$X_A = \frac{C_{A, in} - C_A}{C_{A, in}} = \frac{2 - 0.333}{2} = 0.8335 \approx 83.35\%$$

\\

Deep Dive: Solved Example 2 ? Heat Exchanger Sizing

Problem Statement

A shell-and-tube heat exchanger is used to cool 500 kg/h of hot oil from 150°C to 80°C using water at 20°C. The specific heat capacity of oil is 2.0 kJ/kg·K, and that of water is 4.18 kJ/kg·K. Assuming a counter-current flow and an overall heat transfer coefficient of 500 W/m²·K, determine the required heat exchanger area.

Step-by-Step Solution

Step 1: Calculate the Heat Duty (Q)

\\

$$Q = \text{mass flow rate} \times c_p \times \Delta T$$

\\

\\

$$Q = 500, \text{ kg/h} \times 2.0, \text{ kJ/kg}\cdot\text{K} \times (150 - 80), \text{ K}$$

\\

Convert mass flow rate to kg/s:

\[

$$500 \, \text{kg/h} = \frac{500}{3600} \approx 0.1389 \, \text{kg/s}$$

\]

Calculate Q:

\[

$$Q = 0.1389 \times 2.0 \times 70 = 0.1389 \times 140 = 19.44 \, \text{kJ/s} = 19.44 \, \text{kW}$$

\]

Step 2: Determine the Water Flow Rate

At steady state, the heat gained by water equals the heat lost by oil:

\[

$$Q = m_{\text{water}} c_{p, \text{water}} \Delta T_{\text{water}}$$

\]

Rearranged:

\[

$$m_{\text{water}} = \frac{Q}{c_{p, \text{water}} \times \Delta T_{\text{water}}}$$

\]

Assuming water heats from 20°C to approximately 80°C:

\[

$$\Delta T_{\text{water}} = 80 - 20 = 60 \, \text{K}$$

\]

Calculate:

\[

$$m_{\text{water}} = \frac{19.44 \text{ kW}}{4.18 \text{ kJ/kg} \cdot \text{K} \times 60 \text{ K}} = \frac{19.44}{250.8} \approx 0.0775 \text{ kg/s}$$

\]

Step 3: Calculate Log Mean Temperature Difference (LMTD)

For counter-current flow:

\[

$$\Delta T_1 = T_{\text{hot, inlet}} - T_{\text{cold, outlet}} = 150 - 80 = 70^\circ \text{C}$$

\]

\[

$$\Delta T_2 = T_{\text{hot, outlet}} - T_{\text{cold, inlet}} = 80 - 20 = 60^\circ \text{C}$$

\]

\[

$$\text{LMTD} = \frac{\Delta T_1 - \Delta T_2}{\ln(\Delta T_1 / \Delta T_2)} = \frac{70 - 60}{\ln(70/60)} \approx \frac{10}{\ln(1.1667)} \approx \frac{10}{0.154} \approx 64.94^\circ \text{C}$$

\]

Step 4: Calculate the Area

Using the heat transfer equation:

\[

$$Q = U \times A \times \text{LMTD}$$

\]

Rearranged:

$$\frac{Q}{U \times \text{LMTD}}$$

$$A = \frac{Q}{U \times \text{LMTD}}$$

$$\frac{Q}{U \times \text{LMTD}}$$

Convert Q to watts:

$$\frac{Q}{U \times \text{LMTD}}$$

$$Q = 19.44 \text{ kW}$$

Content Quality and Depth

The 5th Edition excels in providing detailed, technically sound content. Its explanations are thorough, often including derivations of key equations, which serve as valuable learning tools. The inclusion of numerous tables and charts simplifies complex data interpretation, and the practical notes help bridge theory and application.

Strengths include:

- Clear, precise language suitable for both novice and experienced engineers.
- Extensive use of empirical correlations and data for process calculations.
- Practical insights into equipment design and operational optimization.
- Inclusion of safety considerations and environmental concerns relevant to process industries.

Limitations include:

- Some content reflects the technological state of the early 1970s, which may be outdated in certain areas.
- The depth of coverage sometimes assumes a strong prior knowledge, which might challenge beginners.
- The presentation style is dense and text-heavy, potentially overwhelming readers seeking quick reference.

Usability and Accessibility

The handbook is designed as a reference guide rather than a textbook. Its size and layout facilitate rapid lookup but can be cumbersome as a standalone learning resource. Navigational features include:

- A detailed table of contents
- An extensive index
- Cross-referenced topics

However, given its age and printing style, it lacks modern navigational aids such as hyperlinks or digital search functions, which are now standard in digital references.

For practitioners, this means:

- It remains a reliable source for standard data and established methods.
- It requires familiarity with technical terminology for efficient use.
- It can be complemented with more recent texts or online resources for updated information.

Relevance in Modern Context

While the Chemical Engineers Handbook 5th Edition is a product of its time, its core principles remain foundational. Many of the data, correlations, and design methods are still referenced today, especially for classical processes. Nonetheless, users should be aware of:

- Advances in process technology and environmental standards since the 1970s.
- Newer materials, equipment, and safety regulations not covered in this edition.
- Updated data, charts, and computational tools available in modern handbooks and online

databases.

Despite these limitations, the 5th Edition remains a valuable historical document and a solid reference for fundamental engineering principles.

Comparison with Other Editions and Resources

Subsequent editions of the Chemical Engineers Handbook have incorporated modern updates, including digital formats, contemporary data, and expanded coverage. Comparing the 5th Edition with later versions reveals:

- Strengths of the 5th Edition: Depth of fundamental theory, classic data tables, and detailed derivations.
- Weaknesses relative to newer editions: Outdated data, less emphasis on modern environmental and safety standards, and limited digital usability.

Nonetheless, the 5th Edition's comprehensive nature makes it a preferred choice for those interested in the historical development of chemical engineering knowledge or in understanding fundamental concepts that underpin modern practice.

Target Audience and Practical Use

The handbook is best suited for:

- Practicing chemical engineers seeking a reliable reference for process design and troubleshooting.
- Students needing supplementary material with rigorous derivations and data.
- Researchers and educators interested in foundational principles and historical perspectives.

Practical use involves:

- Consulting it during process design or analysis.
- Using tables for quick data retrieval.
- Referencing derivations to understand underlying principles.

It is less suited as an introductory textbook or for quick digital lookups, given its physical format and presentation style.
