Portal Frame Moment Distribution Worked Examples

Portal frame moment distribution worked examples are essential tools for understanding and mastering the analysis of portal frames, a widely used structural system in buildings such as warehouses, industrial facilities, and open-plan commercial spaces. These examples clarify the step-by-step process of applying the moment distribution method, also known as the Hardy Cross method, to determine the moments and shear forces at various points of a portal frame under different loading conditions. By working through detailed examples, students and engineers can develop a practical understanding of the technique, improve their problem-solving skills, and ensure accurate structural analysis for safe and economical design.

Understanding the Basics of Portal Frames and Moment Distribution

What is a Portal Frame?

A portal frame is a rigid, usually steel or reinforced concrete frame, comprising vertical columns and horizontal or pitched rafters. It provides a robust and economical solution for structures requiring large clear spans without intermediate supports. The primary characteristics include:

- Vertical columns that support the roof or floor loads.
- Rafters that span between columns to carry roof loads.
- Rigid joints that transfer moments between members, providing stability.

Fundamentals of Moment Distribution Method

The moment distribution method is a structural analysis technique used to compute moments in statically indeterminate structures. It involves:

- Distributing fixed-end moments based on stiffness.
- Iteratively balancing moments by passing "moments" around the joints until equilibrium is achieved.
- Converging to a set of moments that satisfy compatibility and equilibrium conditions.

Step-by-Step Example of a Portal Frame Analysis Using Moment Distribution

Problem Statement

Consider a single-span portal frame with the following specifications:

- Span length, $L = 6$ m
- Column height, $H = 4$ m
- Rafter fixed at the base, free at the top connection
- Uniformly distributed load (UDL) on the rafter, $w = 10$ kN/m
- Columns are fixed at the foundation and rigidly connected to the rafter

The goal is to determine the moments at the base of the columns and at the mid-span of the rafter using the moment distribution method.

Step 1: Establish the Structural Model and Assumptions

- Assume the frame is planar and composed of rigid joints.
- Neglect the self-weight of members unless specified.
- Apply the load to the rafter, which causes moments at the joints.

Step 2: Calculate the Fixed-End Moments (FEM)

Under the uniform load w , the fixed-end moments at each end of the rafter are:

$$M_{\text{fixed}} = \frac{wL^2}{12}$$

Substituting the values:

$$M_{\text{fixed}} = \frac{10 \times 6^2}{12} = \frac{10 \times 36}{12} = 30, \text{ kNm}$$

Since the load is uniform, the fixed-end moments at both ends are equal and opposite:

- At the left end: +30 kNm
- At the right end: -30 kNm

Step 3: Determine Member Stiffnesses

Calculate the stiffness for the rafter and columns. The stiffness for a member is given by:

$$K = \frac{4EI}{L}$$

for a fixed-end beam, or similar formulations depending on boundary conditions. Assume the following values:

- Modulus of Elasticity, $E = 210 \text{ GPa}$ (for steel)
- Moment of Inertia, $I = 8 \times 10^6 \text{ cm}^4 = 8 \times 10^{-4} \text{ m}^4$

Calculate the stiffness of the rafter:

$$K_{\text{rafter}} = \frac{4EI}{L} = \frac{4 \times 210 \times 10^9 \times 8 \times 10^{-4}}{6}$$

$$K_{\text{rafter}} \approx 112,000 \text{ kNm/rad}$$

(Note: For simplicity, stiffness ratios are used in the moment distribution process, assuming similar units and proportionality.)

Step 4: Initial Moment Distribution

Distribute the fixed-end moments to the joints proportionally to their stiffnesses. For this example, the distribution factors are based on the relative stiffnesses of the members connected at each joint.

- At the joint where the rafter meets the column, distribute the FEM of 30 kNm to the two sides based on stiffness ratios.
- Since the column is assumed to be fixed at the base, initial moments are assigned directly.

Step 5: Apply the Balancing (Iteration) Process

Follow these steps for each iteration:

- Calculate the unbalanced moments at each joint by summing the moments received from adjacent members.
- Distribute the unbalanced moments to the members based on their stiffness factors.
- Update the moments at each joint by adding the distributed moments.
- Repeat the process until the change in moments between iterations is within an acceptable tolerance.

For example, after the first distribution, the moments at the column bases and mid-span are updated. Continuing iterations leads to convergence on the final moments.

Step 6: Final Moments and Shear Forces

Once the distribution converges, the moments at critical points are:

- Base of columns: moments indicating the bending moment capacity required for the columns.
- Mid-span of the rafter: maximum moment, which can be checked against member capacity.

Additionally, shear forces can be derived from the moments for design purposes.

Additional Worked Examples for Different Loading and Support Conditions

Example 2: Single-Span Portal Frame with Point Loads

Suppose a portal frame with a point load applied at mid-span. The steps involve calculating fixed-end moments for the point load, distributing moments, and applying the iterative balancing process similar to the previous example. The key difference is the fixed-end moments are based on point load effects rather than uniform loads.

Example 3: Two-Span Portal Frame

Analyzing a two-span portal frame involves considering the additional supports and internal hinges. The method extends by including more joints and distributing moments accordingly. The process remains similar, but the complexity increases with the number of members and supports.

Tips for Effective Portal Frame Moment Distribution Analysis

- **Ensure accurate calculation of member stiffnesses:** Use correct material and section properties.
- **Start with fixed-end moments:** They form the basis of the distribution process.
- **Accurately perform distribution and balancing:** Pay attention to the distribution factors based on stiffness ratios.
- **Use iterative calculations:** Continue until moments stabilize within acceptable limits.
- **Validate results:** Cross-check with other methods such as finite element analysis or simplified beam calculations.

Conclusion

Mastering portal frame moment distribution worked examples is fundamental for structural engineers involved in designing and analyzing portal frame structures. Through systematic application of the method—calculating fixed-end moments, distributing them based on stiffness ratios, and iterating to convergence—engineers can accurately determine the internal moments and shear forces. These examples not only enhance theoretical understanding but also develop practical skills for real-world structural analysis. Whether dealing with uniform loads, point loads, or complex multi-span frames, the moment distribution method remains a reliable and insightful approach to ensuring safe and efficient portal frame designs.

Portal Frame Moment Distribution Worked Examples: A Comprehensive Guide for Structural Engineers

Understanding how to perform portal frame moment distribution calculations is essential for structural engineers designing and analyzing rigid frame structures. Portal frames are common in industrial, commercial, and agricultural buildings due to their efficient load-carrying capacity and simplicity. Mastering portal frame moment distribution worked examples enables engineers to accurately predict moment diagrams, shear forces, and reactions, ensuring safe and economical designs. This article provides a detailed, step-by-step walkthrough of typical moment distribution problems encountered when analyzing portal frames, complete with numerical examples, explanations, and tips to enhance your understanding.

What is Moment Distribution in Portal Frames?

Before diving into worked examples, it's crucial to grasp the fundamental concept of moment distribution in portal frames. Moment distribution is an iterative method used for analyzing indeterminate structures—those with more unknown reactions than equilibrium equations. It simplifies complex frame analysis by distributing moments at joints based on their stiffness, considering the fixed-end moments, and iterating until the moments stabilize.

In portal frames, the key elements are:

- Vertical columns: Typically fixed or pinned at the base and connected to the beam at the head.
- Horizontal beam: Usually rigid or semi-rigid, spanning between columns.
- Joints: The points where members connect, often acting as hinges or fixed supports.

The goal is to determine the moments at each joint, the shear forces in members, and the reactions at supports, considering the applied loads and boundary conditions.

Step-by-Step Guide to Portal Frame Moment Distribution

Step 1: Structural Model and Data Collection

Start by defining:

- Geometry: span lengths of beams and heights of columns.
- Support conditions: fixed, pinned, or roller supports.
- Loads: point loads, uniform loads, or varying loads.
- Material and section properties: stiffness characteristics of members.

Example Data:

- Frame height (H): 6 meters
- Beam span (L): 8 meters
- Vertical supports: pinned at the base
- Loads: uniform load of 10 kN/m on the beam
- Fixed support at the base of columns

Step 2: Calculate Fixed-End Moments

Determine the fixed-end moments (FEMs) induced by the loads, assuming the members are fixed at the joints:

- For a uniformly distributed load (w) on a simply supported beam of span L:
- FEM at each end = $\left(\frac{wL^2}{12} \right)$
- For the given example:
- $(w = 10, \text{ kN/m})$
- $(L = 8, \text{ m})$
- FEM at each end = $\left(\frac{10 \times 8^2}{12} = \frac{10 \times 64}{12} \approx 53.33 \right)$,

\text{kNm} \)

Step 3: Establish the Stiffness Factors

Calculate the stiffness (K) of the members:

- For a beam: $K_{\text{beam}} = \frac{4EI}{L}$ for fixed-fixed ends, but in portal frame analysis, often the stiffness at joints is simplified.

- For columns: stiffness depends on their moment of inertia and boundary conditions.

Express the relative stiffness of members connected at each joint, which influences how moments are distributed.

Step 4: Initial Moment Distribution

- Assume initial moments at joints are zero.

- Distribute the fixed-end moments proportionally based on member stiffness:

- For each joint, compute the distribution factor:

\[

\text{Distribution factor} = \frac{\text{Member stiffness}}{\text{Sum of stiffnesses at the joint}}

\]

- Example:

- Column stiffness (K_c): based on (EI) and height.

- Beam stiffness (K_b): based on (EI) and span.

- Distribute fixed-end moments according to these factors.

Step 5: Perform Moment Distribution Iterations

- Carry over the moments from one joint to another, considering the distribution factors.
- Apply carry-over factors:
 - Typically, for a fixed-end beam, the moment is carried over as half to each end.
- Repeat the distribution and carry-over steps until the moments converge (changes are negligible).

Tip: Use a table format to track moments, distribution factors, and carry-over values for clarity.

Step 6: Finalize Moments and Shear Forces

- Once the moments stabilize, use the joint moments to compute:
 - Member shear forces
 - Bending moment diagrams
 - Reactions at supports
- Check that the sum of moments and shear forces satisfy equilibrium equations.

Worked Example: Analyzing a Portal Frame with Uniform Loads

Let's now walk through a detailed example of analyzing a simple portal frame subjected to uniform loads.

Given Data:

- Frame height: 6 m
- Beam span: 8 m
- Uniform load on beam: 10 kN/m

- Supports: pinned at base (both columns)
- Material: standard steel with $(EI = 2 \times 10^{11} \text{ Nm}^2)$ (for simplicity, assume equal stiffness for columns and beam)

Step 1: Calculate Fixed-End Moments

- Fixed-end moments at each beam end:

$\lfloor$

$$FEM = \frac{wL^2}{12} = \frac{10 \times 8^2}{12} = \frac{10 \times 64}{12} \approx 53.33, \text{ kNm}$$

$\rfloor$

- Since the frame is symmetrical, fixed-end moments are equal at both ends.

Step 2: Establish Member Stiffnesses and Distribution Factors

Assuming equal stiffness, the distribution factors at each joint are 0.5 for the beam ends. For the columns, stiffness depends on their moment of inertia; assuming equal stiffness, the moments are distributed evenly.

Step 3: Initial Distribution

- Distribute the fixed-end moments:
- At each joint, distribute 53.33 kNm equally to the two connected members.
- After this initial distribution, moments are assigned at each joint.

Step 4: Iterative Moment Distribution

- Carry over moments to neighboring joints, considering the stiffness ratios.

- Repeat the process until the moments stabilize?i.e., the difference between successive iterations is negligible.

Step 5: Final Moments and Reactions

- Once the process converges, sum the moments and apply equilibrium equations to find support reactions.

- For example, the vertical reactions at supports can be found by summing the vertical loads and considering the moments.

Practical Tips for Accurate Portal Frame Moment Distribution

- Use consistent units throughout calculations.
- Create detailed tables to track distribution factors, moments, and carry-over values.
- Validate assumptions about member stiffness; real-world members may have different stiffnesses.
- Perform a hand check using equilibrium equations after moment distribution to confirm results.
- Use software tools for complex frames, but understanding the manual process enhances comprehension.

Conclusion

Mastering portal frame moment distribution worked examples equips structural engineers with the skills to analyze complex frames with confidence. By meticulously calculating fixed-end moments, establishing stiffness factors, distributing moments iteratively, and verifying results through equilibrium checks, engineers can ensure their designs are both safe and economical. Practice with varied loading conditions, geometries, and support configurations will deepen your understanding and proficiency in portal frame analysis?an essential competency in structural engineering.

Remember: The key to proficiency is practice. Work through multiple examples, compare manual results with software outputs, and continually refine your approach. Happy analyzing!
