The E-R diagram serves as a blueprint for creating relational schemas.

Normalization and Schema Design

Normalization is a systematic approach to organizing data to reduce redundancy and dependency. The process involves decomposing tables to achieve various normal forms, such as:

- First Normal Form (1NF)

- Second Normal Form (2NF)
- Third Normal Form (3NF)
- Boyce-Codd Normal Form (BCNF)

Proper normalization enhances data integrity and query performance.

Relational Model and SQL

Core Concepts of the Relational Model

The relational model organizes data into tables (relations), with each table consisting of rows (tuples) and columns (attributes). Key principles include:

- Primary keys uniquely identify tuples
- Foreign keys establish relationships between tables
