Sample Solved Problem from DSP Proakis

Problem Statement

Given an LTI system with an impulse response $h[n] = (0.8)^n u[n]$, where $u[n]$ is the unit step function, find the system's output when the input is $x[n] = 2 \cos(\pi n/4)$.

Step-by-Step Solution

1. Recognize the System and Input

The system is linear and time-invariant (LTI), characterized by $h[n]$. The input is a cosine sequence.

2. Express the Input in Complex Exponential Form

Using Euler's formula:

$$x[n] = 2 \cos\left(\frac{\pi n}{4}\right) = \operatorname{Re}\{2 e^{j\pi n/4}\}$$

3. Find the System's Frequency Response $H(e^{j\omega})$

The Z-transform of $h[n]$:

$$H(z) = \sum_{n=0}^{\infty} (0.8)^n z^{-n} = \frac{1}{1 - 0.8 z^{-1}}, \quad |z| > 0.8$$

Evaluate on the unit circle $(z = e^{j\omega})$:

$$H(e^{j\omega}) = \frac{1}{1 - 0.8 e^{-j\omega}}$$

4. Compute $H(e^{j\pi/4})$

Substitute $\omega = \pi/4$:

$$H(e^{j\pi/4}) = \frac{1}{1 - 0.8 e^{-j\pi/4}}$$

Calculate numerator and denominator:

$$e^{-j\pi/4} = \cos(\pi/4) - j \sin(\pi/4) = \frac{\sqrt{2}}{2} - j \frac{\sqrt{2}}{2}$$

Thus:

$$1 - 0.8 e^{-j\pi/4} = 1 - 0.8 \left(\frac{\sqrt{2}}{2} - j \frac{\sqrt{2}}{2} \right) = 1 - 0.8 \frac{\sqrt{2}}{2} + j 0.8 \frac{\sqrt{2}}{2}$$

$$j 0.8 \frac{\sqrt{2}}{2}$$

$$\backslash]$$

Numerical evaluation:

$$\backslash[$$

$$0.8 \frac{\sqrt{2}}{2} \approx 0.8 \times 0.7071 \approx 0.5657$$

$$\backslash]$$

So:

$$\backslash[$$

$$\text{Real part: } 1 - 0.5657 = 0.4343$$

$$\backslash]$$

$$\backslash[$$

$$\text{Imaginary part: } 0.5657$$

$$\backslash]$$

Magnitude:

$$\backslash[$$

$$|D| = \sqrt{(0.4343)^2 + (0.5657)^2} \approx \sqrt{0.1886 + 0.3200} \approx \sqrt{0.5086} \approx 0.713$$

$$\backslash]$$

Phase:

$$\backslash[$$

$$\angle D = \arctan \left(\frac{0.5657}{0.4343} \right) \approx \arctan(1.304) \approx 52.5^\circ$$

\]

Therefore:

\[

$$H(e^{j\pi/4}) = \frac{1}{D} = \frac{1}{|D| e^{j\angle D}} = \frac{1}{0.713 e^{j 52.5^\circ}} = 1.4 e^{-j 52.5^\circ}$$

\]

5. Find the System Output in Frequency Domain

The output's frequency component:

\[

$$Y(\omega) = H(e^{j\omega}) X(\omega)$$

\]

Since:

\[

$$X(\omega) = 2\pi \delta\left(\omega - \frac{\pi}{4}\right) + 2\pi \delta\left(\omega + \frac{\pi}{4}\right)$$

\]

The relevant component:

\[

$$Y(\pi/4) = H(e^{j\pi/4}) \times 2$$

\]

Similarly, the negative frequency component:

\[

$$Y(-\pi/4) = H(e^{-j\pi/4}) \times 2$$

\\

But because the input is real, the output is the sum of these conjugate components.

6. Final Time-Domain Output

The output is:

\\

$$y[n] = \text{Re} \left\{ 2 H(e^{j\pi/4}) e^{j\pi n/4} \right\}$$

\\

Using the calculated $H(e^{j\pi/4})$:

\\

$$|H| = 1.4, \quad \angle H = -52.5^\circ$$

\\

Thus:

\\

$$y[n] = 2 \times 1.4 \times \cos \left(\frac{\pi n}{4} - 52.5^\circ \right) \approx 2.8 \times \cos \left(\frac{\pi n}{4} - 52.5^\circ \right)$$

\\
