- Weather Conditions: Clear skies are ideal; overcast or stormy weather hampers celestial observations.
- Time of Day: For sun sights, mid-morning to mid-afternoon is best; for stars, clear night conditions are necessary.
- Location: Open, unobstructed horizons free from land or structures that could block celestial bodies.

Step-by-Step Instructions for Using the Mark 3 Sextant as a GPS Backup

Using the sextant for navigation involves several stages: calibration, taking sightings, recording data, and performing sight reduction to determine your position. Below is an in-depth guide.

- Calibration of the Sextant

Calibration ensures your sextant provides accurate readings.

Procedure:

- Check for Zero Error:
 - Hold the sextant vertically with the index arm at zero.
 - Look at a distant object at eye level.
 - If the horizon and the object are aligned when the index arm reads zero, zero error is minimal.
 - If not, note the error and adjust the sextant's micrometer or record the error for correction during calculations.

- Adjust for Index Error:
 - Use the micrometer to find the point where the horizon and celestial object align.
 - Record this reading for correction.

- Planning Your Sightings
 - Identify Target Celestial Bodies:
 - The Sun (for daytime), Polaris (for navigation at night in the Northern Hemisphere), or other navigational stars.
 - Determine the Time:
 - Accurate timekeeping is crucial. Use your chronometer to record the exact time of your sighting.

- Taking the Sight

Procedure:

- Set Up:
 - Find a stable position, preferably seated or lying down.
 - Use the sunshade for solar observations to protect your eyes.
- Align the Sextant:
 - Look through the eyepiece and adjust the index arm until the celestial body appears to touch the horizon line.
 - Fine-tune using the micrometer to get a precise reading.
- Record the Reading:
 - Note the altitude angle (the degree measurement) and the exact time.
 - Repeat the process to ensure consistency.

- Recording Data

- Log the Observation:
- Record date, time, body observed, altitude angle, and any corrections (index error, dip, refraction).
- Calculate the Corrected Altitude:
- Apply corrections:
 - Index Error Correction
 - Dip Correction: Accounts for the height of your eye above sea level.
 - Refraction Correction: Based on altitude and atmospheric conditions.
 - Semi-diameter Correction: For the Sun or Moon, if applicable.
- Sight Reduction and Position Fix

Using the recorded data, you determine your position via sight reduction:

- Calculate the Greenwich Hour Angle (GHA) and Declination:
- Use your nautical almanac with the exact time.
- Apply Sight Reduction Tables:
- Determine the intercept and line of position (LOP).
- Plot the LOP:
- On a chart, mark the line based on your observations.
- The intersection of multiple lines from different sights provides a fix.
