How to Use the ITE Trip Generation Rates 8th Edition

Using the ITE Trip Generation Rates 8th Edition involves several key steps:

- Identify the Land Use Category

Choose the most appropriate land use classification that matches your project (e.g., "Office," "Fast Food Restaurant," "Multi-family Housing").

- Determine the Appropriate Trip Rate

Use the tables to find the average trips per unit for your land use and specific size or capacity of the project.

- Quantify Development Size

Establish the size or capacity of your project?square footage, number of units, seats, etc.?to apply the trip rate accurately.

- Calculate Trip Estimates

Multiply the trip rate by the development size to estimate total trips. For example:

``Estimated Trips = Trip Rate × Development Size``

- Adjust for Local Conditions

Consider regional factors, site-specific characteristics, and operational considerations that may increase or decrease trip estimates.

- Apply Time-of-Day Distributions

Use the guide?s data on peak hour trips to analyze traffic impacts during specific periods.

Practical Example: Estimating Trips for a New Retail Center

Suppose a developer plans to build a 50,000 square foot retail shopping center. Here's how to

estimate trips using the 8th edition:

- Step 1: Identify the land use category as "Shopping Center."
- Step 2: Find the average daily trip rate for "Shopping Center" in the tables?say, 20 trips per 1,000 sq ft.
- Step 3: Calculate total trips:

$$(50,000 \text{ sq ft} / 1,000) \times 20 \text{ trips} = 50 \times 20 = 1,000 \text{ trips per day}$$

- Step 4: Adjust for peak hours, regional factors, or other site-specific considerations if necessary.

This process provides a foundational estimate, which can then be refined through detailed analysis, local surveys, or modeling.
