Fundamentals of Airborne Radar Systems

What is Radar?

Radar, an acronym for Radio Detection and Ranging, is a system that uses radio waves to detect objects and measure their distance, speed, and other characteristics. It involves transmitting electromagnetic waves toward targets and analyzing the echoes that bounce back.

Basic Principles of Radar Operation

The core working principle of radar involves three main steps:

- Transmission: The radar system emits a burst of radio waves via its antenna.
- Propagation: These waves travel through the atmosphere at the speed of light.
- Reflection and Reception: When waves encounter an object, they reflect back toward the radar antenna. The system then receives and processes these echoes to determine target information.

Why Airborne Radar?

Airborne radar systems are mounted on aircraft, helicopters, drones, or missiles, providing a mobile platform for:

- c = speed of light ($\sim 3 \times 10^8$ m/s)
- t = time delay between transmitted pulse and received echo

Velocity Detection

Using the Doppler effect, radar can measure the relative speed of a target based on the frequency shift of the returned signal.
