Whether you're a student working on a physics investigation or a curious visitor eager to understand the science behind the thrills, understanding the physics concepts involved in amusement park rides can deepen your appreciation and improve your learning experience.

This article provides comprehensive and detailed answers to common physics investigation questions related to Lake Compounce rides, including concepts such as force, acceleration, energy conservation, momentum, and safety mechanisms. Through clear explanations, examples, and relevant calculations, you'll gain insights into how physics explains the operation and safety of amusement rides.

Understanding the Physics Behind Lake Compounce Rides

Amusement rides at Lake Compounce are designed with a careful application of physics principles to ensure both excitement and safety. Analyzing these rides involves concepts like Newton's laws of motion, energy transformations, centripetal force, and friction.

Key Physics Concepts in Rides:

- Potential and Kinetic Energy: Rides often convert potential energy (due to height) into kinetic energy (motion).

- Newton's Laws of Motion: Explaining acceleration, deceleration, and force interactions during ride operation.
- Centripetal Force and Acceleration: Critical for rides such as roller coasters and spinning rides.
- Friction and Air Resistance: Factors affecting ride speed, energy loss, and safety.

Common Questions and Answers in Lake Compounce Physics Investigation

1. How does potential energy convert to kinetic energy on a roller coaster?

Answer:

On a roller coaster, the initial climb to the highest point increases the car's potential energy. As the coaster descends, this potential energy is converted into kinetic energy, causing the car to accelerate.

Example Calculation:

Suppose the highest point of the coaster is 50 meters above the ground. Ignoring friction and air resistance, the potential energy (PE) at the top is:

$$PE = m \times g \times h$$

Where:

- m = mass of the coaster car + passengers (e.g., 500 kg)
- $g = 9.8 \text{ m/s}^2$
- $h = 50 \text{ meters}$

$$PE = 500 \text{ kg} \times 9.8 \text{ m/s}^2 \times 50 \text{ m} = 245,000 \text{ Joules}$$

At the bottom of the descent, this energy is primarily kinetic:

$$KE = 0.5 \times m \times v^2$$

Since energy is conserved:

$$PE_{\text{initial}} = KE_{\text{final}}$$

$$245,000 \text{ J} = 0.5 \times 500 \text{ kg} \times v^2$$

$$v^2 = (2 \times 245,000 \text{ J}) / 500 \text{ kg} = 980 \text{ m}^2/\text{s}^2$$

$$v = \sqrt{980} \approx 31.3 \text{ m/s}$$

Implication:

The coaster reaches speeds of approximately 31.3 m/s (about 112 km/h) at the bottom, illustrating the energy transformation.

2. What role does centripetal force play in a spinning ride at Lake Compounce?

Answer:

Centripetal force is the inward force required to keep an object moving in a circular path. For spinning rides like the Wave Swinger or the Cyclone, passengers experience this force as they are pushed outward due to inertia.

Calculation Example:

If a car spins in a circle with a radius of 10 meters at 5 revolutions per minute (rpm), what is the centripetal acceleration?

First, convert rpm to angular velocity (ω):

- 1 revolution = 2π radians
- 5 rpm = 5 revolutions per minute

$$\omega = (5 \text{ rev/min}) \times (2\pi \text{ rad/rev}) / 60 \text{ sec} = (10\pi \text{ rad/min}) / 60 \approx 0.5236 \text{ rad/sec}$$

Centripetal acceleration (a_c):

$$a_c = \omega^2 \times r = (0.5236)^2 \times 10 \approx 2.74 \text{ m/sec}^2$$

Interpretation:

Passengers feel a force proportional to mass times this acceleration, which explains the sensation of being pushed outward.

3. How do safety mechanisms like seat belts and harnesses utilize physics principles?

Answer:

Safety devices at Lake Compounce are designed to counteract the forces experienced during sudden stops or turns, following Newton's laws. When a ride decelerates rapidly, inertia causes passengers to continue moving forward. Seat belts and harnesses exert an opposite force to decelerate passengers safely.

Physics Principles:

- Newton's Second Law ($F = m \times a$): The force exerted by safety devices is proportional to the mass and acceleration.
- Impulse and Momentum: Safety restraints provide an impulse force over a short time to reduce the change in momentum, ensuring passenger safety.

Example:

If a passenger (70 kg) experiences a sudden deceleration of 5 g (where $g = 9.8 \text{ m/s}^2$), the force exerted is:

$$F = m \times a = 70 \text{ kg} \times (5 \times 9.8 \text{ m/s}^2) = 70 \times 49 = 3430 \text{ N}$$

The harness must withstand this force to keep the passenger secure.

4. How does friction influence the operation of rides at Lake Compounce?

Answer:

Friction acts as an energy loss mechanism, converting kinetic energy into heat and reducing the efficiency and speed of rides. Engineers design rides to minimize friction where necessary but also account for it in safety considerations.

Impact of Friction:

- Energy Loss: Friction reduces the maximum speed of rides over time unless counteracted by additional energy input (like chain lifts).
- Braking Systems: Friction is used intentionally in brakes to safely slow or stop rides.
- Safety Margins: Calculations include frictional forces to ensure rides operate within safe limits.

Example:

If a roller coaster experiences a frictional force of 2000 N over a segment, this force works against the motion, reducing the coaster's kinetic energy and speed.

Applying Physics to Enhance Safety and Experience at Lake Compounce

Understanding the physics behind rides helps in designing safer and more exhilarating attractions. Engineers use principles such as energy conservation and force analysis to optimize ride design, ensuring that thrill-seekers experience maximum excitement without compromising safety.

Safety Enhancements:

- Designing for Max Speed and G-Forces: Calculations ensure forces remain within human tolerance.
- Regular Maintenance: Friction and wear are monitored to prevent unsafe energy losses or failures.
- Emergency Braking Systems: Use of friction and mechanical brakes to safely decelerate rides.

Enhancing Experience:

- Optimizing Heights and Curves: To maximize potential energy and acceleration.

Lake Compounce Physics Investigation Answers: Unlocking the Science Behind Amusement Park Thrills

The excitement of a day at Lake Compounce, one of America's oldest and most beloved amusement parks, often masks the fascinating physics principles at play behind each exhilarating ride. From towering roller coasters to spinning rides and water attractions, the physics investigations conducted by students and curious visitors alike reveal the science that makes these rides both thrilling and safe. This article delves into the core concepts behind Lake Compounce's rides, providing detailed answers to common physics investigation questions, and exploring how fundamental principles govern the dynamics of amusement park attractions.

Understanding the Physics Investigation at Lake Compounce

Many students and educators visit Lake Compounce for physics investigations, aiming to understand concepts such as force, energy, motion, and acceleration through real-world examples. These investigations often involve measuring variables such as speed, acceleration, potential and kinetic energy, and forces acting on the rides. The answers derived from these investigations not only deepen comprehension of physics principles but also illustrate their practical applications.

The Role of Newton's Laws in Amusement Rides

Newton's Laws of Motion form the backbone of understanding how rides operate.

First Law: Inertia and Ride Safety

- An object at rest stays at rest, and an object in motion stays in motion unless acted upon by an external force.
- In rides, safety harnesses and restraints are essential to counteract inertia, preventing riders from continuing forward during sudden stops or turns.
- Example: When a roller coaster suddenly halts, riders tend to lurch forward due to inertia. Restraints counteract this, ensuring safety.

Second Law: Force, Mass, and Acceleration

- The acceleration of an object depends on the net force acting upon it and its mass ($F=ma$).
- Application: During rapid acceleration or deceleration on a coaster, the force experienced by riders can be calculated by knowing their mass and the acceleration.

Third Law: Action and Reaction

- For every action, there's an equal and opposite reaction.
- Application: When a coaster pushes against the track, the track pushes back with an equal force, enabling motion.

Physics Investigation Answer: Calculating the forces experienced by riders during various segments of a ride involves applying Newton's second law, considering the mass of the rider and the acceleration due to the ride's motion.

Energy Transformations in Amusement Park Rides

Understanding energy conservation is crucial when analyzing rides.

Potential and Kinetic Energy

- Potential Energy (PE): Stored energy due to position, such as the height of a roller coaster at the top of a hill.
- Kinetic Energy (KE): Energy due to motion, at its maximum when the coaster is at its fastest.

Investigation Questions & Answers:

- How does height affect the speed of the roller coaster?

The higher the initial height, the greater the potential energy, which converts into higher kinetic energy as the coaster descends, leading to increased speed.

- Is energy conserved during the ride?

In an ideal, frictionless system, yes. However, real-world factors like friction and air resistance dissipate some energy as thermal energy, slightly reducing the maximum speed at lower points.

Application: By measuring the height of the initial drop and the speed at various points, students can verify the conservation of energy principle and quantify energy losses.

Calculating Speed and Acceleration

How to determine ride parameters:

- Speed: Measured using motion sensors, GPS devices, or timing methods.
- Acceleration: Calculated from changes in speed over time or by using accelerometers.

Sample Calculation:

Suppose a coaster drops from a height of 30 meters:

- Potential energy at top: $PE = mgh$

(where m = mass of rider + coaster, $g = 9.8 \text{ m/s}^2$, $h = 30 \text{ m}$)

- Assuming negligible energy loss, the speed at the bottom:

$$KE = PE$$

$$\frac{1}{2}mv^2 = mgh$$

$$v = \sqrt{2gh}$$

$$v = \sqrt{2 \times 9.8 \text{ m/s}^2 \times 30 \text{ m}} \approx 24.2 \text{ m/s}$$

This calculation demonstrates how initial height influences final speed, aligning with the physics investigation answers.

Centripetal Force and Circular Motion

Many rides involve circular motion, requiring a grasp of centripetal force.

Centripetal Force is the inward force needed to keep an object moving in a circle:

$$F_c = m v^2 / r$$

Where:

- m = mass

- v = velocity
- r = radius of the circle

Investigation Focus:

- Riders experience increased "g-forces" during sharp turns or loops.
- The apparent weight increase is due to the net force acting towards the center of the circle, which can be calculated and related to the physics investigation answers.

Practical Example:

At the top of a loop, if a coaster moves at 15 m/s in a radius of 5 meters:

$$F_c = (m \times 15^2) / 5 = 45m \text{ N}$$

- The riders feel a force equivalent to multiple times their weight, depending on the magnitude of F_c relative to their mass.

Friction and Air Resistance: Factors Affecting Ride Dynamics

No real-world system is perfectly frictionless. Friction between the coaster wheels and tracks, as well as air resistance, influence ride speed and energy conservation.

Physics investigation answers:

- How much energy is lost due to friction?

By measuring the difference between expected and actual speeds, students can estimate energy loss.

- What role does friction play in safety?

Friction ensures that coasters do not slide uncontrollably on tracks, allowing for controlled acceleration and deceleration.

Safety Considerations and Physics

Safety systems are based on physics principles:

- Restraints: Designed to counteract inertial forces during sudden stops or turns.
- Brake systems: Use friction and electromagnetic forces to slow rides safely.
- Structural integrity: Calculations involving stress, strain, and material strength ensure the tracks can withstand forces during operation.

Physics Investigation Answer: Properly designed safety features depend on accurate calculations of forces, energy, and material properties, ensuring rider safety while maintaining the thrill.

Practical Applications of Physics at Lake Compounce

Beyond educational investigations, physics principles are applied daily:

- Ride design involves complex calculations of forces, energy, and motion.
- Regular maintenance includes stress testing and safety checks grounded in physics.
- Engineers continually analyze ride data to optimize performance and safety.

Problema: Trova l'equazione di una retta perpendicolare a quella passante per il punto $A(2, 3)$ e che passi per il punto $B(4, 1)$.

Soluzione:

- Trova l'equazione della retta passante per A e B :

\[

$$m_{AB} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{1 - 3}{4 - 2} = -1$$

\]

- La retta perpendicolare avrà pendenza:

\[

$$m_{\text{perp}} = -\frac{1}{m_{AB}} = 1$$

\]

- Equazione della retta passante per $(A(2, 3))$:

\[

$$y - 3 = 1(x - 2) \rightarrow y = x + 1$$

\]

Risultato: La retta cercata è $(y = x + 1)$.

Esercizio 2: Circonferenza passante per tre punti

Problema: Determinare l'equazione della circonferenza passante per i punti $(P(1, 2))$, $(Q(3, 4))$, e $(R(5, 0))$.

Soluzione:

- Scrivere il sistema di equazioni per la circonferenza:

\[

$$(x - h)^2 + (y - k)^2 = r^2$$

\]

per ciascun punto, sostituendo le coordinate.

- Risolvere il sistema per trovare (h, k, r) .

- La soluzione porta all'equazione:

$$\{$$

$$(x - 3)^2 + (y - 1)^2 = 8$$

$$\}$$

The questions often involve analyzing rides, calculating speeds, accelerations, forces, and energies associated with amusement park attractions, which serve as engaging contexts for mastering physics principles.

Core Physics Concepts in Lake Compounce Rides

Kinematics: Describing Motion

Many questions in the physics packet focus on the kinematics of rides—how objects move without considering the causes of motion. Typical problems involve:

- Calculating velocity and acceleration of rides at various points.
- Analyzing the motion of roller coasters or other attractions as they ascend, descend, or move along tracks.

Example: Determining the speed of a roller coaster at the bottom of a drop.

Dynamics: Forces and Newton's Laws

Understanding the forces acting on riders and rides is key. These problems often involve:

- Calculating the normal force experienced by riders.
- Analyzing the effects of gravity and friction.
- Applying Newton's Second Law ($F = ma$) to find net forces and accelerations.

Example: Finding the force exerted on a rider at the peak of a hill.

Energy Conservation

Many questions leverage the principle of conservation of energy, which states that energy cannot be created or destroyed, only transformed. Typical problems include:

- Calculating potential and kinetic energy at different points.
- Understanding how energy is conserved as rides move along tracks.

Example: Determining the speed of a ride at various points assuming no energy losses.

Momentum and Collisions

In some scenarios, the packet explores momentum and elastic or inelastic collisions, especially relevant for rides with moving parts or interactions.

Example: Analyzing the impact force during a sudden stop or collision.

Step-by-Step Approach to Solving Typical Lake Compounce Physics Problems

To effectively solve questions in the physics packet, a structured approach is recommended:

- Read the problem carefully. Identify what is given and what needs to be found.
- Draw a diagram. Visual representations clarify the scenario.
- List known quantities. Write down given data such as mass, height, velocity, etc.
- Identify relevant physics principles. Decide whether to use kinematics, energy conservation, forces, or momentum.
- Choose appropriate equations. Select the formulas that relate the knowns to the unknowns.
- Perform calculations step-by-step. Show all work for clarity.
- Check units and reasonableness of the answer. Ensure the result makes sense physically.

Sample Problems and Solutions

Example 1: Calculating Speed at the Bottom of a Drop

Problem: A roller coaster car with a mass of 500 kg is released from rest at the top of a 40-meter-high hill. Assuming no energy losses, what is the speed of the car at the bottom of the hill?

Solution:

- Knowns:
- Height (h): 40 m
- Mass (m): 500 kg
- Initial velocity (u): 0 m/s

- Relevant principle: Conservation of mechanical energy:

Total energy at the top = Potential energy (PE)

Total energy at the bottom = Kinetic energy (KE)

- Calculations:

$$PE_{\text{top}} = m g h = 500 \text{ kg } 9.8 \text{ m/s}^2 40 \text{ m} = 196,000 \text{ J}$$

$$KE_{\text{bottom}} = (1/2) m v^2$$

Set $PE_{\text{top}} = KE_{\text{bottom}}$:

$$196,000 \text{ J} = (1/2) 500 \text{ kg } v^2$$

$$v^2 = (2 \cdot 196,000 \text{ J}) / 500 \text{ kg} = 784 \text{ m}^2/\text{s}^2$$

$$v = \sqrt{784} = 28 \text{ m/s}$$

Answer: The car reaches approximately 28 meters per second at the bottom of the hill.

Example 2: Normal Force at the Peak of a Vertical Loop

Problem: A roller coaster speeds through a vertical loop of radius 15 meters. If the speed at the top of the loop is 10 m/s, what is the normal force exerted on a 70 kg rider at that point?

Solution:

- Knowns:
- Radius (r): 15 m
- Speed (v): 10 m/s
- Mass (m): 70 kg
- g: 9.8 m/s²

- Step 1: Calculate the centripetal force:

$$F_c = m v^2 / r = 70 \text{ kg} (10 \text{ m/s})^2 / 15 \text{ m} = 70 \cdot 100 / 15 \approx 466.67 \text{ N}$$

- Step 2: Determine the forces at the top:

At the top of the loop, the forces are:

- Gravity downward: $m g = 70 \cdot 9.8 \approx 686 \text{ N}$
- Normal force (N): exerted by the seat, upward

The net inward (centripetal) force is:

$$F_c = N + m g \text{ (since both act downward at the top)}$$

Rearranged:

$$N = F_c - m g = 466.67 \text{ N} - 686 \text{ N} \approx -219.33 \text{ N}$$

- Interpretation: The negative value indicates that the normal force is directed upward relative to the rider's position at the top, meaning the seat exerts a force of approximately 219.33 N upward on the rider, but since force directions are relative, it signifies that the rider experiences a loose feeling or slight weightlessness.

Answer: The normal force exerted on the rider is approximately 219 N upward, indicating a feeling of reduced weight at the top of the loop.

Addressing Common Challenges and Misconceptions

While solving physics problems related to amusement park rides can be straightforward, several misconceptions hinder understanding:

- Ignoring energy losses: Real rides experience friction and air resistance, so assuming perfect energy conservation can lead to overestimations.
- Confusing normal force with weight: Normal force varies depending on the ride's acceleration; it is not always equal to weight.
- Misapplying equations: Using the wrong physics principle (e.g., energy conservation when forces are dominant) can cause errors.
- Forgetting units: Always check units to ensure consistency and correctness.

Educators recommend emphasizing these aspects to help students develop a nuanced understanding of physics in real-world contexts.

Physics Day provides a unique opportunity for learners to connect classroom theories with practical applications. It bridges the gap between abstract concepts and tangible experiences, making physics more accessible and engaging. By understanding the answers to common questions, participants can:

- Enhance their understanding of key physics principles.
- Improve problem-solving skills.
- Develop a deeper appreciation for science in everyday life.

Common Questions and Their Answers

Question 1: How Do Roller Coasters Use Potential and Kinetic Energy?

One of the most popular demonstrations during Physics Day involves roller coasters. Participants often ask how these rides convert energy and what physics principles are at play.

Answer Overview

Roller coasters operate on the principle of energy conservation, primarily involving potential energy and kinetic energy.

- **Potential Energy at the Peak:** When the coaster is pulled to the top of the first hill, it gains gravitational potential energy (GPE). This energy depends on the height of the hill and the mass of the coaster.
- **Conversion to Kinetic Energy:** As the coaster descends, potential energy converts into kinetic energy (KE), which propels the coaster forward and downward.
- **Energy Conservation:** Assuming minimal friction and air resistance, the total mechanical energy remains constant throughout the ride.
- **Energy Losses:** In real situations, some energy is lost due to friction and air resistance, which explains why coasters need initial height boosts and brakes to slow down safely.

Key Formula

The potential energy and kinetic energy are calculated as:

- Potential Energy: $PE = mgh$
- Kinetic Energy: $KE = \frac{1}{2}mv^2$

Where:

- m = mass of the coaster
- g = acceleration due to gravity ($\sim 9.8 \text{ m/s}^2$)
- h = height above ground
- v = velocity of the coaster

Question 2: Why Do Rides Feel Faster or Slower?

Participants often wonder about the sensation of speed on different rides and why some rides feel more thrilling than others.

Answer Overview

The perceived speed depends on multiple factors, including the actual velocity, acceleration, and changes in gravity experienced during the ride.

- **Velocity:** The faster the ride moves, the higher the kinetic energy, leading to a sensation of increased speed.
- **Acceleration:** Rapid changes in acceleration, such as sharp turns or drops, enhance the feeling of speed due to increased inertial forces.
- **G-Forces:** The forces exerted on the body during rapid accelerations or decelerations contribute to sensations of speed and excitement.
- **Ride Design:** Rides with steep drops or tight turns increase perceived speed even if the actual velocity isn't the highest.

Question 3: How Do Bridges and Towers Use Engineering Principles?

Many visitors are curious about the physics involved in constructing bridges and towers at amusement parks and elsewhere.

Answer Overview

Engineering structures like bridges and towers are designed using principles of static equilibrium, material strength, and force distribution.

- **Statics and Equilibrium:** Structures are designed to balance forces so they remain stable under various loads.
- **Material Strength:** Choice of materials ensures that structures can withstand forces without breaking or deforming.
- **Force Distribution:** Load-bearing elements distribute weight evenly, reducing stress on any single component.
- **Safety Factors:** Engineers incorporate safety margins to account for unexpected stresses or loads.

Question 4: What Is the Physics Behind Water Rides?

Water rides are a staple at amusement parks, and many ask how physics explains their thrill and safety.

Answer Overview

Water rides involve fluid dynamics, gravity, and momentum.

- **Gravity and Free Fall:** Sudden drops accelerate riders downward, creating a feeling of weightlessness and thrill.
- **Friction and Drag:** Water provides resistance, affecting speed and acceleration.
- **Flow Dynamics:** The movement of water in channels and splash zones is governed by principles of fluid mechanics.
- **Safety Measures:** Rides are designed considering forces and speeds to ensure rider safety, with restraints and controlled speeds.

Applying Physics Concepts to Solve Problems

Tip 1: Break Down the Problem

Identify the physical principles involved?whether energy conservation, forces, motion, or fluid dynamics. Write down known quantities and what needs to be found.

Tip 2: Use Relevant Formulas

Select the appropriate physics formulas based on the problem. For example, for energy questions, use $(PE = mgh)$ and $(KE = \frac{1}{2}mv^2)$.

Tip 3: Consider Assumptions

Remember that real-world scenarios often involve energy losses due to friction. When solving theoretical problems, assume ideal conditions unless specified.

Tip 4: Check Units and Dimensions

Ensure all quantities are in consistent units to avoid calculation errors.

Tip 5: Relate Back to the Context

Connect your mathematical solutions to the physical phenomena, like explaining how a certain velocity causes a specific sensation.

Sample Problem and Solution

Problem:

A roller coaster climbs to a height of 50 meters. Assuming no energy losses, what is the speed of the coaster at the bottom of the hill?

Solution:

- Calculate potential energy at the top:
- $(PE = mgh = m \times 9.8, \text{m/s}^2 \times 50, \text{m})$
- At the bottom, all potential energy converts into kinetic energy:
- $(KE = \frac{1}{2}mv^2)$
- Set $(PE = KE)$:
- $(m \times 9.8 \times 50 = \frac{1}{2} m v^2)$
- Simplify:
- $(9.8 \times 50 = \frac{1}{2} v^2)$
- Solve for (v) :
- $(v^2 = 2 \times 9.8 \times 50 = 980)$
- $(v = \sqrt{980} \approx 31.3, \text{m/s})$

Answer: The coaster's speed at the bottom is approximately 31.3 m/s.

The questions often revolve around motion, forces, energy, and momentum—topics that are not only central to physics but also directly observable in amusement park rides and attractions.

Common Themes in Lake Compounce Physics Day Questions

To effectively approach the problems, recognize some recurring themes:

- Kinematics and Motion
 - Calculating velocities, accelerations, or times based on initial conditions.
 - Analyzing motion along curved paths, such as roller coasters or rides.

- Forces and Newton's Laws

Sample Lake Compounce Physics Day Question and Step-by-Step Solution

Let's consider a representative question that embodies the typical challenges posed during the event:

Question:

A roller coaster car starts from rest at a height of 40 meters above the ground. Assuming negligible air resistance and friction, what is the speed of the car at the bottom of the drop?

Step 1: Identify Known and Unknown Variables

- Initial height, $(h_i = 40\text{ m})$
- Final speed at the bottom, $(v_f = ?)$
- Initial speed, $(v_i = 0\text{ m/s})$ (starts from rest)
- Acceleration due to gravity, $(g = 9.8\text{ m/s}^2)$

Step 2: Recognize Relevant Physics Principles

This problem involves energy conservation:

- Potential energy at the top converts to kinetic energy at the bottom.
- Assuming no energy losses, total mechanical energy remains constant.

Step 3: Write Down the Energy Conservation Equation

\[

$$PE_{\text{initial}} + KE_{\text{initial}} = PE_{\text{final}} + KE_{\text{final}}$$

\]

Since the car starts from rest:

\[

$$m g h_i + 0 = 0 + \frac{1}{2} m v_f^2$$

\]

The mass (m) cancels out:

\[

$$g h_i = \frac{1}{2} v_f^2$$

\]

Step 4: Solve for (v_f)

\[

$$v_f = \sqrt{2 g h_i}$$

\]

Plugging in the values:

\[

$$v_f = \sqrt{2 \times 9.8 \, \text{m/s}^2 \times 40 \, \text{m}} = \sqrt{784} = 28 \, \text{m/s}$$

\]

Answer:

The roller coaster car reaches a speed of approximately 28 meters per second at the bottom of the drop.

Additional Example: Circular Motion on a Ride

Question:

On a spinning amusement ride, a 100 kg rider is seated in a circular seat rotating with a radius of 5 meters. If the rider experiences a centripetal acceleration of 4 m/s², what is their speed?

Step 1: Recall the Centripetal Acceleration Formula

\[

$$a_c = \frac{v^2}{r}$$

\]

Step 2: Rearrange to solve for (v) :

\[

$$v = \sqrt{a_c \times r}$$

\]

Step 3: Substitute known values:

\[

$$v = \sqrt{4 \, \text{m/s}^2 \times 5 \, \text{m}} = \sqrt{20} \approx 4.47 \, \text{m/s}$$

\]

Answer:

The rider's speed is approximately 4.47 meters per second.
